

Define a pure substance.

How can you distinguish a pure substance from an impure substance?

What will happen to the above if there are impurities in the sample?

What is a formulation?

Give some everyday examples of where formulations are used.

1. _____
2. _____
3. _____
4. _____
5. _____
6. _____

What does chromatography separate?

Describe how the process works. Use the diagram to help.

Complete the word equation for calculating the Rf value.

Rf = _____

How does the Rf value allow you to identify a substance?

What colour does litmus go if chlorine is present?

What is the Rf value of the following chromatogram?

The distance moved by substance B is 30mm and the distance moved by solvent A is 52mm.

What are the 2 phases of chromatography?

1. _____
2. _____

Describe the test for oxygen.

I understand the following topic...

I need to work on the following topic...

What gas does this experiment test for?

What gas does this experiment test for?

What colour does the limewater go if the gas is present?

a

Define a pure substance.
When nothing has been added to a substance.

How can you distinguish a pure substance from an impure substance?
The melting and boiling points of substances allows you to distinguish one substance from another. e.g. pure water boils at 100°C.

What will happen to the above if there are impurities in the sample?
**They will lower the melting point.
 They will increase the boiling point.**

b

What is a formulation?
Useful mixtures that have a particular use.

Give some everyday examples of where formulations are used.
paint, fertilisers, cleaning products, fuels, cosmetics, nail polish, perfume, medicine, pesticides, inks.

c

What does chromatography separate?
It separates 2 or more soluble substances in a mixture.

Describe how the process works. Use the diagram to help.
**The solvent moves up the paper. As it moves, it takes the mixture with it.
 The more soluble the substance, the farther it moves up the paper.
 Some are not as soluble so do not travel as far. They separate into different spots.**

Complete the word equation for calculating the Rf value.

$$R_f = \frac{\text{distance moved by substance (B)}}{\text{distance moved by solvent (A)}}$$

How does the Rf value allow you to identify a substance?
Each solvent has a different Rf value.

e

What colour does litmus go if chlorine is present?
It turns white.

f

What is the Rf value of the following chromatogram?
 The distance moved by substance B is 30mm and the distance moved by solvent A is 52mm.

$$R_f = \frac{30}{52} = 0.58$$

g

What are the 2 phases of chromatography?

- Mobile phase**
Where the molecules can move.
- Stationary phase**
Where the molecules can not move.

h

Describe the test for oxygen.
If a glowing splint is put into a test tube filled with oxygen, the splint will relight.

I understand the following topic...

I need to work on the following topic...

i

What gas does this experiment test for?
It is the test for hydrogen gas.

j

What gas does this experiment test for?
It is the test for carbon dioxide

What colour does the limewater go if the gas is present?
Cloudy white.
